**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listing, of claims in the application.

1. (Currently amended) A combination of an analytical tool and a temperature detecting analytical device, the temperature detecting analytical device comprising a housing including a mounting portion for mounting the analytical tool capable of outputting information for computation, a computation unit for conducting computation for analyzing a sample based on said information for computation, and a temperature detection unit for outputting temperature information,

wherein said mounting portion comprises a table having a projecting portion protruding from said housing;

wherein said analytical tool comprises a substrate separate from said mounting portion and a reagent portion formed on said substrate, said reagent portion being located above said projecting portion of said table outside said housing when said analytical tool is mounted onto said mounting portion; and

wherein said temperature detection unit is located on said projecting portion of said table directly below and in vertical alignment with said reagent portion when said analytical tool is mounted on said mounting portion.

2. (Previously presented) The combination according to claim 1, wherein the temperature detecting analytical device further comprises a temperature correction unit for correcting the computation results obtained in said computation unit, based on said temperature information.

3. (Previously presented) The combination according to claim 1, wherein said temperature detection unit comprises a contact type temperature sensor.

4. (Previously presented) The combination according to claim 3, wherein said temperature detection unit comprises a thermally conductive portion having a contact surface for contact with said temperature sensor and said analytical tool.
5. (Previously presented) The combination according to claim 4, wherein said thermally conductive portion is formed of a material with a thermal conductivity of higher than  $0.10 \text{ cal}/(^{\circ}\text{C}\cdot\text{cm}\cdot\text{sec})$ .
6. (Previously presented) The combination according to claim 5, wherein said thermally conductive portion is formed of a material with a thermal conductivity of higher than  $0.15 \text{ cal}/(^{\circ}\text{C}\cdot\text{cm}\cdot\text{sec})$ .
7. (Canceled)
8. (Previously presented) The combination according to claim 4, wherein said temperature sensor and said thermally conductive portion are sealed with a resin package in said projecting portion of said table.
9. (Previously presented) The combination according to claim 3, wherein said temperature detection unit comprises a contact type temperature sensor, and  
the temperature sensor is disposed in direct contact with said analytical tool when said analytical tool is mounted on said mounting portion.
10. (Previously presented) The combination according to claim 1, wherein said temperature detection unit comprises a non-contact type temperature sensor.
11. (Canceled)
12. (Previously presented) The combination according to claim 1, wherein said reagent portion comprises an enzyme.

13. (Previously presented) The combination according to claim 12, wherein said enzyme has a catalytic action with respect to oxidation reaction of glucose.
14. (Previously presented) The combination according to claim 1, wherein said analytical tool is disposable.
15. (Previously presented) The combination according to claim 1, wherein said mounting portion comprises an insertion portion for inserting an end portion of said analytical tool.
16. (Canceled)
17. (Previously presented) The combination according to claim 15, further comprising a push-down portion disposed in said housing for pushing down said analytical tool against said table portion.
18. (Previously presented) The combination according to claim 17, wherein said analytical tool comprises an output unit for outputting said information for computation, said push-down portion being brought into contact with said output unit and inputting said information for computing.
19. (Previously presented) The combination according to claim 18, wherein said push-down portion is an electrically conductive plate spring.
20. (New) The combination according to claim 1, wherein the housing includes an insertion opening directly above the table, the analytical tool further includes a cover formed over the substrate, the substrate extending beyond the cover for insertion into the insertion opening, the cover coming into stopping contact with the housing upon insertion

of the substrate into the insertion opening for positioning said temperature detection unit directly below and in vertical alignment with said reagent portion.
